

RFind Systems, Inc.

When you need to know where something is...
Don't just look for it...

RFind it!

Expeditor 2D™ Software

RFind's **Expeditor 2D™** Software is a core component of our 3-element 915MHz RTLS architecture:

- ✓ **Tags**
- ✓ **Gateway**
- ✓ **Expeditor 2D™ Software**

Expeditor 2D™ is a ready to use software application that forms part of RFind System's leading edge active RFID real time locating product line. The RFind solution provides affordable, precise and complete asset identification and location data.

Some of the key features of the Expeditor 2D system are:

- Trilateral targeting algorithms
- Metrics gathering and reporting
- Process definition and alarms
- Optimization and analysis
- Works with RFind's **TAQnav™** technology

What is TAQnav™?

TAQnav is an acronym for "Tag Acquisition Query navigation", RFind's patent pending tag to tag technology for precise locating.

Trilateral targeting algorithms provide users with immediate location information of all tagged assets. The **Expeditor 2D™** software analyzes this data and determines parameters such as in-process time, non-value added time, and travel time of tagged assets.

The system is user configurable and enables users to have alerts generated when assets experience activity that is outside of typical process.

Expeditor 2D™ is a tool to help companies become more profitable through production efficiency. Under continuous improvement, the **Expeditor 2D™** product will grow with your organization, and add new process metrics and reports.

RFind Systems specializes in providing asset awareness systems to manufacturing and yard management applications to improve productivity, quality, and reduce cost.

To find out more about the functionality, and pricing of **Expeditor 2D™**, please contact RFind Systems, Inc.

Specifications – Software*

Operating System

- User – Windows 2000, XP, CE
- Server – Windows 2000 Server, 2003 Server

Database

- SQL2000, 2005
- Oracle 9i, 10g

Features

- Easy to manage user permissions
- Mapping interface to display asset location
- Remote configuration and diagnostics
- Alert functions for exception notification
- Web based interface for quick deployment across a network
- Integrates into existing applications
